

Domains & Hostings

Adding a new website (Domain or Subdomain)

1. Go to Files folder and navigate to wwwroot

2. Create folder for the new website or subdomain. A folder can be created in root or inside another folder.

3. Upload the contents in the newly created folder. (Can be done later too)

4. Go to **Website** Link and add Website

Domains & Hostings

The screenshot displays a web management interface. On the left is a dark sidebar with navigation options: Home, Website, FTP, Databases, Docker, Monitor, and Security. The 'Website' option is highlighted with a red arrow. The main content area has tabs for 'PHP Project' (selected) and 'Node Project'. Below the tabs, there's a green 'Add site' button and buttons for 'Default Page' and 'Default Website'. A table lists existing sites with columns for checkboxes, Site name, Status, and Back. Two sites are listed: 'ashoksquest.org' and 'python.ashoksqu...'. Both are 'Running' (indicated by a green play icon) and 'Not' (indicated by an orange stop icon). At the bottom, there's a 'Please choose' dropdown and an 'Execute' button. A red arrow points from the 'Add site' button to the first checkbox in the table.

<input type="checkbox"/>	Site name ▲	Status ▼	Back
<input type="checkbox"/>	ashoksquest.org	Running ▶	Not
<input type="checkbox"/>	python.ashoksqu...	Running ▶	Not

5. Enter the website URL and click the browse button to select Website Path.

If the directory is not created using steps 1 & 2 above, then simply type a suitable name and it will be created by the system

Domains & Hostings

Add site - Support batch site building

Create site

Batch create

Wordpress deploy

Domain name

bhc.ashoksquest.org

Description

bhc_ashoksquest_org

Website Path

/www/wwwroot/bhc.ashoksquest.org

FTP

Not create

FTP is not installed, click Install
