## Adding a new website (Domain or Subdomain)

1. Go to Files folder and navigate to wwwroot

| □ 159.69.44.70 0 ← Root dir > www > wwwroot > ( |        |                            |                      |             |            |            |                     |    |  |  |  |  |  |
|---|--------|----------------------------|----------------------|-------------|------------|------------|---------------------|----|--|--|--|--|--|

| 🕞 Log out                                       |        |                            |                      |             |            |            |                     |    |  |  |  |  |  |
| +   |        |                            |                      |             |            |            |                     |    |  |  |  |  |  |

2. Create folder for the new website or subdomain. A folder can be created in root or inside another folder.

3. Upload the contents in the newly created folder. (Can be done later too)

4. Go to Website Link and add Website

| <b>[]</b> 159.69.44.70 |          |     | PHP Project |     | Node P          |      |            |             |        |
